METHODOLOGY, SAMPLE FRAME CONSTRUCTION AND DATA COLLECTION PROCEDURES

This poll is commissioned by the Pennsylvania Medical Society and conducted by Susquehanna Polling and Research, Inc¹. Interviews were conducted September 2019 with 300 registered voters in Lackawanna County, Pennsylvania. Survey respondents are randomly contacted using random selection procedures, and all telephone interviews are conducted using live telephone agents. The sample frame was compiled using random telephone sequence methods, and includes both landline and cellular households, purchased from a certified list vendor; all households are pre-screened to eliminate household telephone numbers on the federal Do Not Call registry in compliance with all applicable federal and state laws. Only known registered voters were contacted, compiled from a list of households with prior vote history in 1 of 6 or better general elections (G18, G17, G16, G15, G14, and/or G13). Voters who registered to vote after the 2018 general election are also included and eligible to participate.

Interviews are closely monitored to ensure a representative sample of the county electorate is achieved based on party registration, geography, gender, age and other demographics; results are sometimes statistically weighted to adjust for coverage bias or non-response error.

The margin of error for a sample size of 300 interviews is +/-5.6% at the 95% confidence level.
